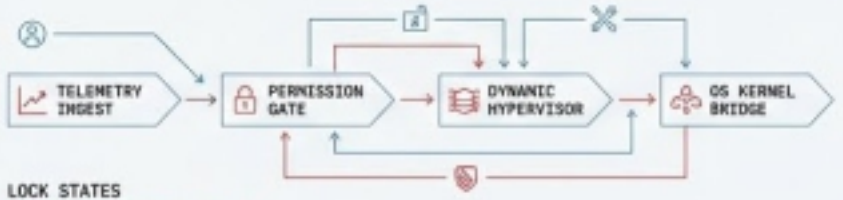
Mandated Vehicle Hands Free SmartPhone Access System

Auto Dock State Machine Architecture

A technical teardown of intelligent telemetry integration, permission gating, and dynamic OS hypervision.



LOCK STATES

[LOCKED] SECURE_BOOT

[LOCKED] REMOTE_ACCESS_DENIED

```
> EXECUTE_TEARDOWN_SEQUENCE
  // SYS_AUTH_GRANTED
```

AV INITIATING...

Domistat Innovation

info@domistat.com

State 0: System Initiation and Hardware Handshake

Node 1: Physical Trigger: Ignition sequence initiated via Start/Stop button.

Node 2: Telemetry Broadcast: Vehicle ECU broadcasts 'Engine ON' signal via CAN bus.

Node 3: Proximity Handshake: Auto Dock hardware intercepts signal, triggering encrypted Bluetooth/NFC handshake with the docked mobile device.

Node 4: State Transition: Mobile device acknowledges ping. OS-level command executed.

```
STATE_CHANGE: CAR_MODE_ACTIVATED
```

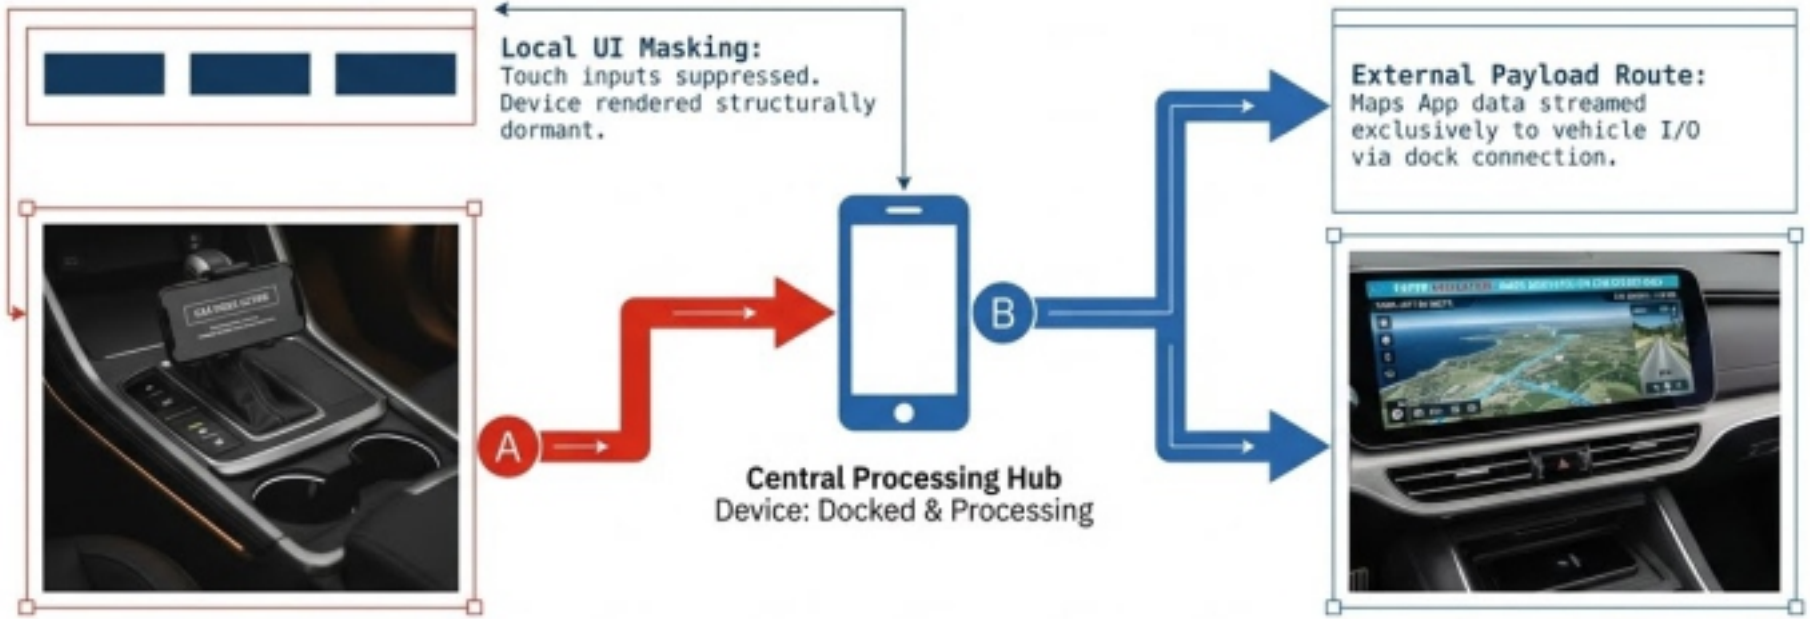
Car Mode engages instantly upon ignition, ensuring distraction-free operation.

Logic Gate 1: Intelligent Role Detection and Spatial Authorization

Dimension	Driver (Left Seat / Docked)	Passenger (Right Seat / Undocked)
Spatial Zone	Driver Region	Passenger Region
Core UI Access	LOCKED	UNLOCKED
Background Routing	ACTIVE (Auto-reply enabled)	INACTIVE
Infotainment Takeover	MAPS_PAYLOAD_ONLY	BYPASS_GRANTED

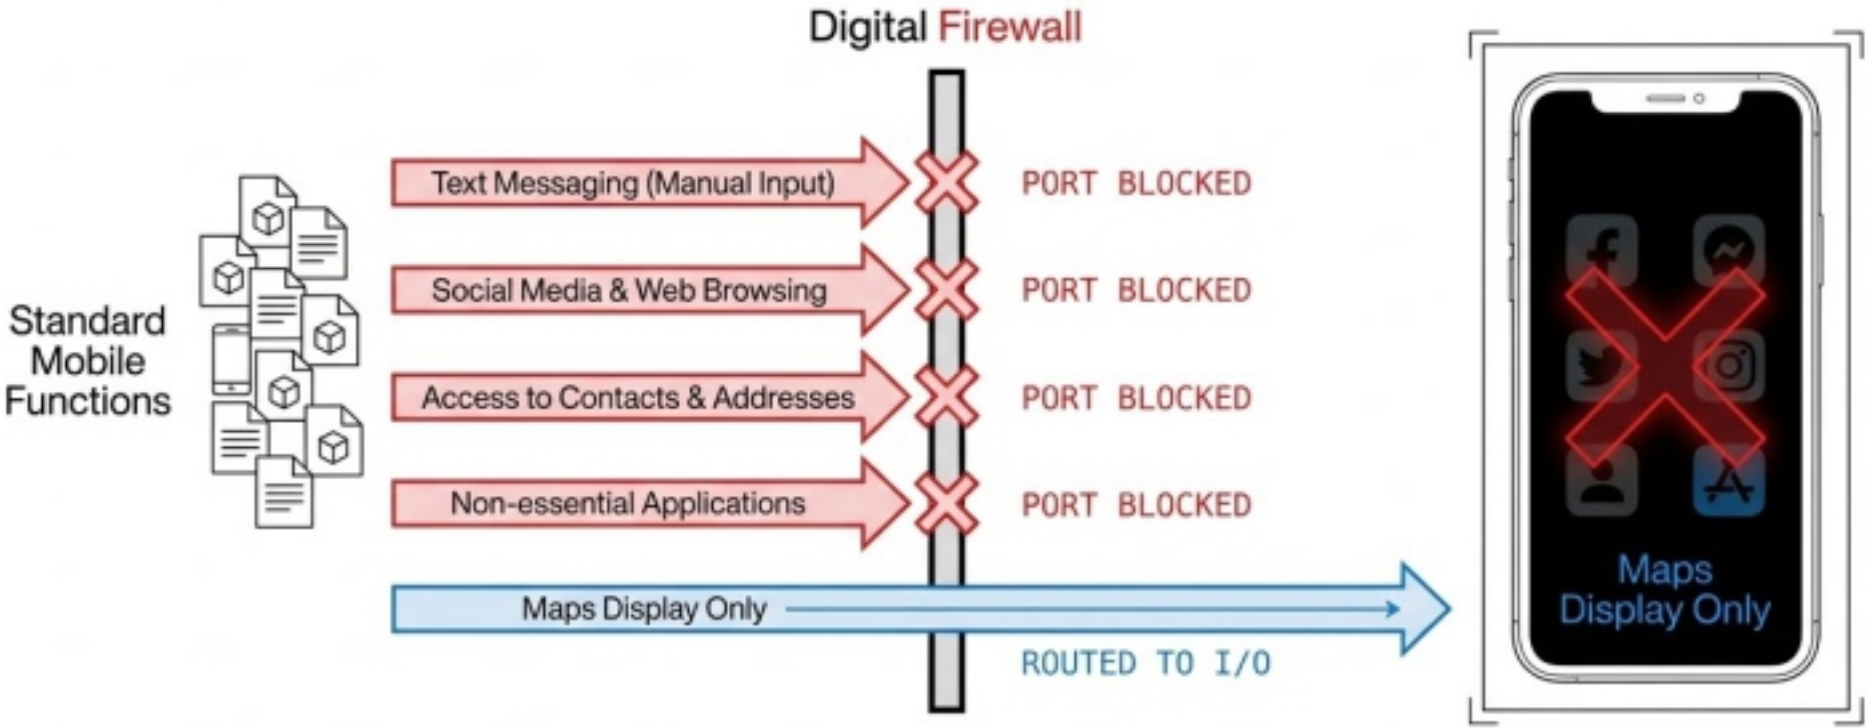
Key Insight: The system does not indiscriminately brick devices; it intelligently distinguishes between driver and passenger roles to maintain unrestricted phone use for non-operators.

State 1 Execution: UI Masking and Payload Distribution



Safer Navigation: Maps displayed on car screen only. The device operates as a headless processor, fulfilling GPS functions while local UI interaction is heavily restricted.

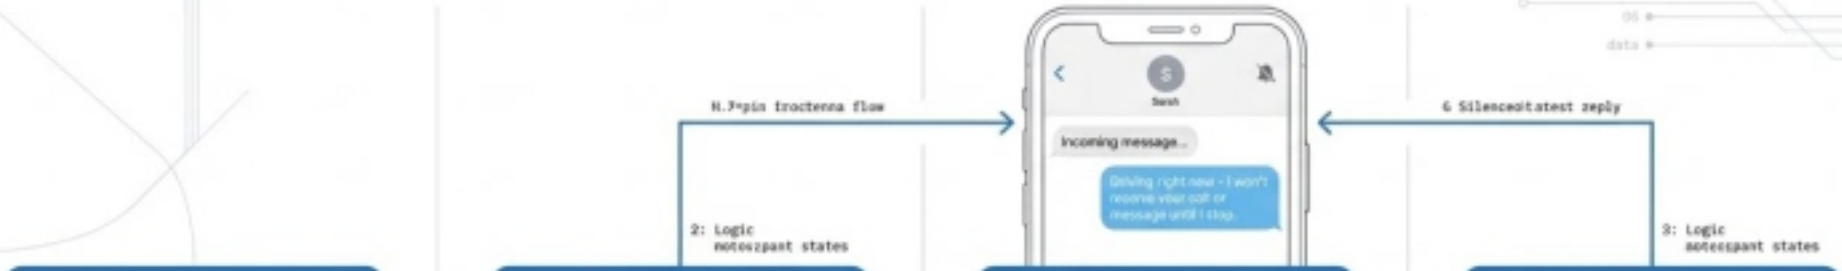
Application Layer Firewall: Dynamic Restriction Protocols



The system executes an OS-level lockdown with highly specific whitelisted protocols to guarantee essential functionality without manual input.

DOMISTAT INNOVATION

Protocol Handlers: Asynchronous Auto-Reply Interception



Incoming call or message hits the device baseband.

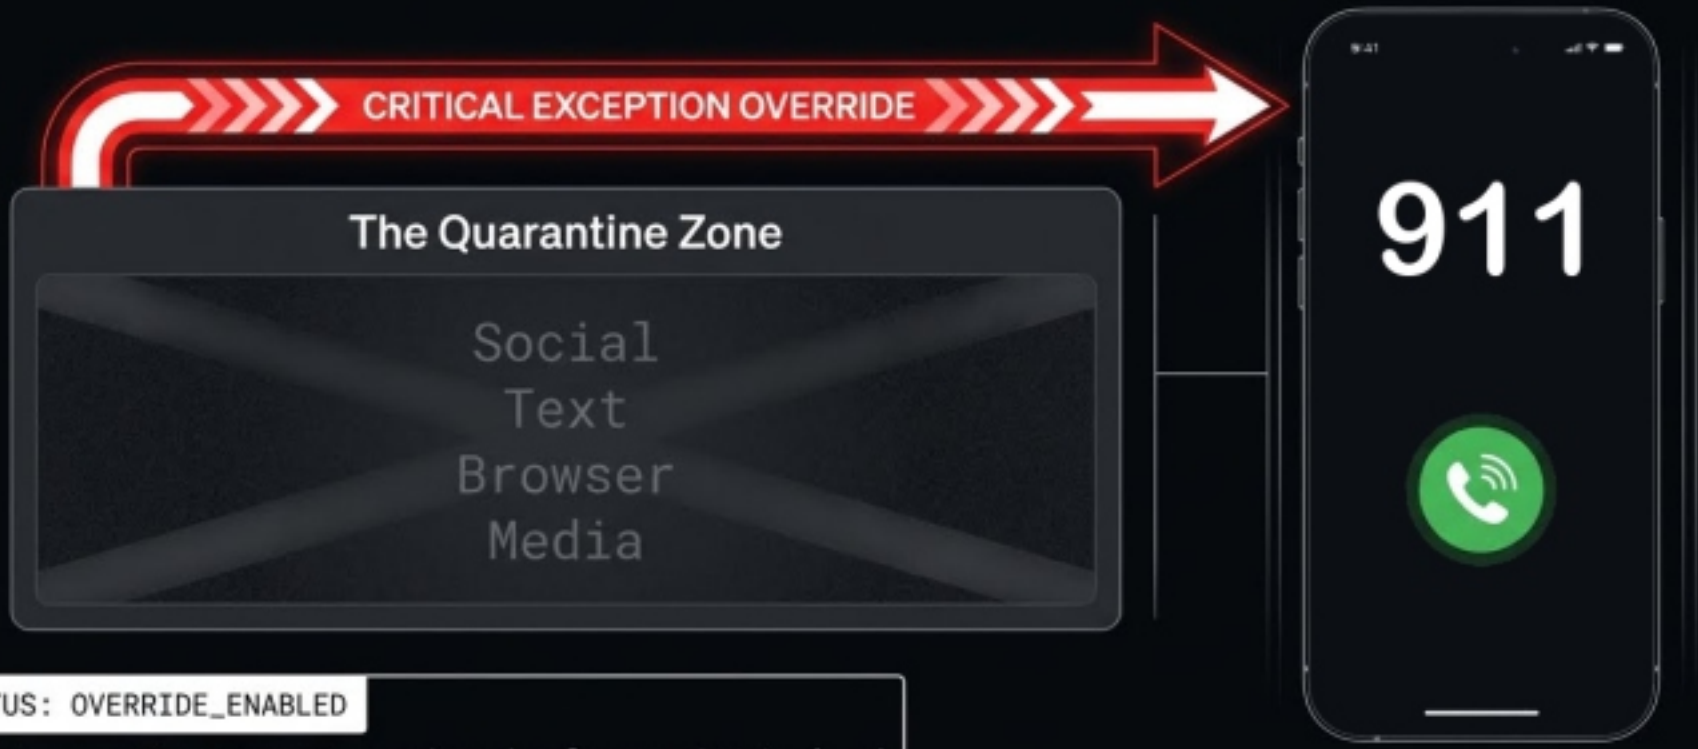
Auto Dock background protocol intercepts the packet. UI notification rendering is forcefully suppressed.

System automatically generates and transmits standardized payload.

Event is logged to the device without waking the physical screen or triggering audio alerts.

Communication management isolates the driver from real-time communication inputs, ensuring focus remains solely on the road.

Critical Overrides: Dedicated Emergency Safety Tunnels

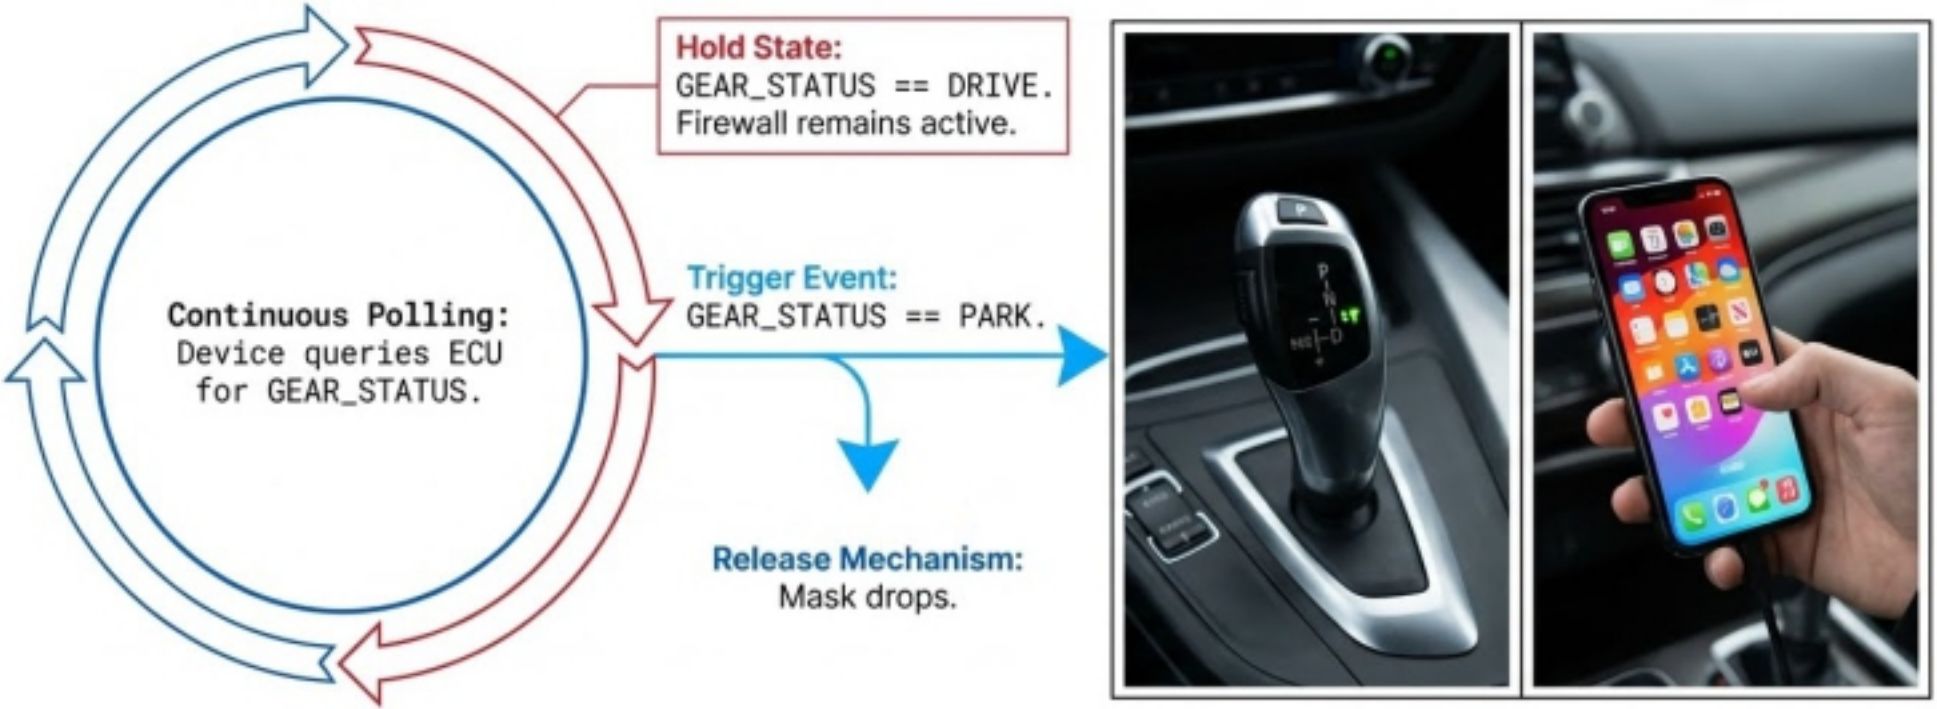


STATUS: OVERRIDE_ENABLED

Direct access to emergency services is always maintained and guaranteed. Immediate help is accessible without needing to exit Car Mode or interface with complex UI elements.

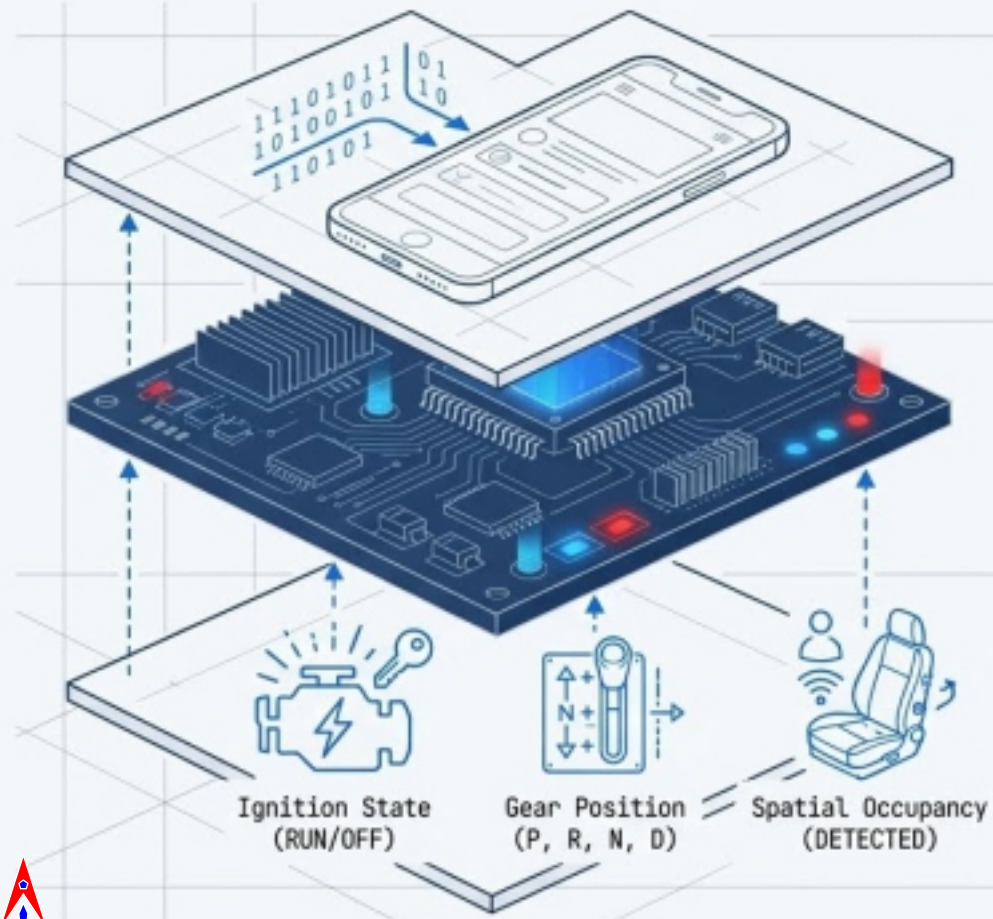
DOMISTAT INNOVATION

State 2 Termination: Telemetry Release Triggers



Full phone access is restored only when the vehicle is safely parked. Instant access to entertainment and communication protocols resumes as standard OS permissions are reinstated.

System Synthesis: The Context-Aware Dynamic Hypervisor



Dynamic OS Allocation

Frictionless granting and revoking of mobile device permissions.

```
[OS_PERMISSION_GRANT: SUCCESS;
ALLOCATE_RESOURCES: OK]
```

The Hypervisor (Auto Dock)

Central logic brain evaluates inputs against the safety matrix.

```
[EVALUATE_TELEMETRY: TRUE;
CHECK_SAFETY_RULES: TRUE]
```

Telemetry Ingestion

Auto Dock is not merely a passive charging accessory.

It functions as a dynamic hypervisor—a continuously active bridge between vehicle hardware and mobile operating systems.

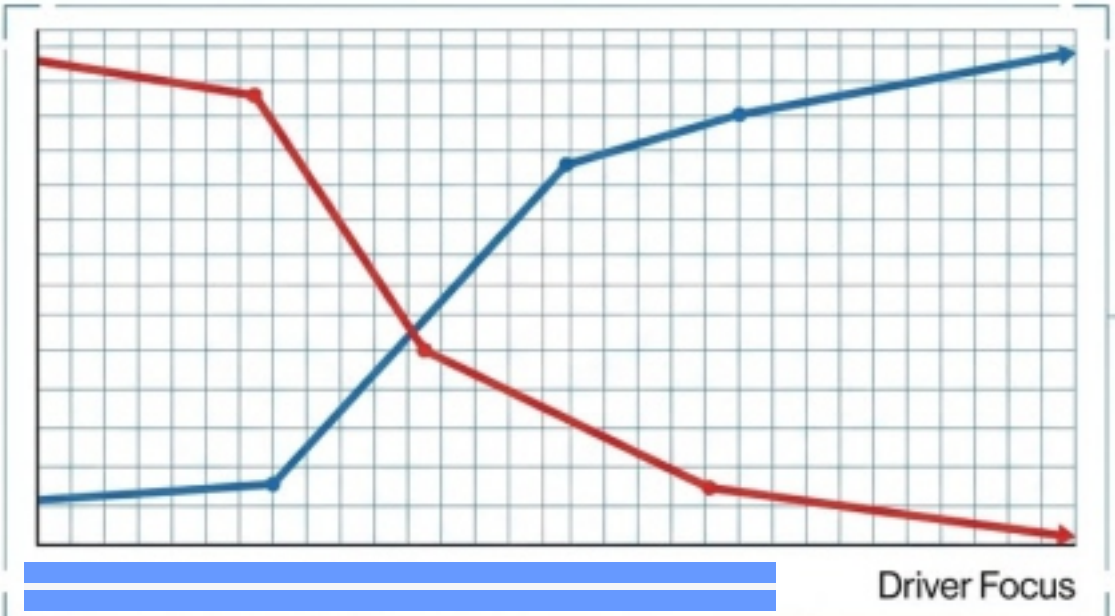
It enforces total situational awareness to manage digital attention programmatically, without user friction.

```
[SYSTEM_STATUS:
ACTIVE_HYPERVISOR;
ENFORCING_PROTOCOL:
SITUATIONAL_AWARENESS_V1.2]
```

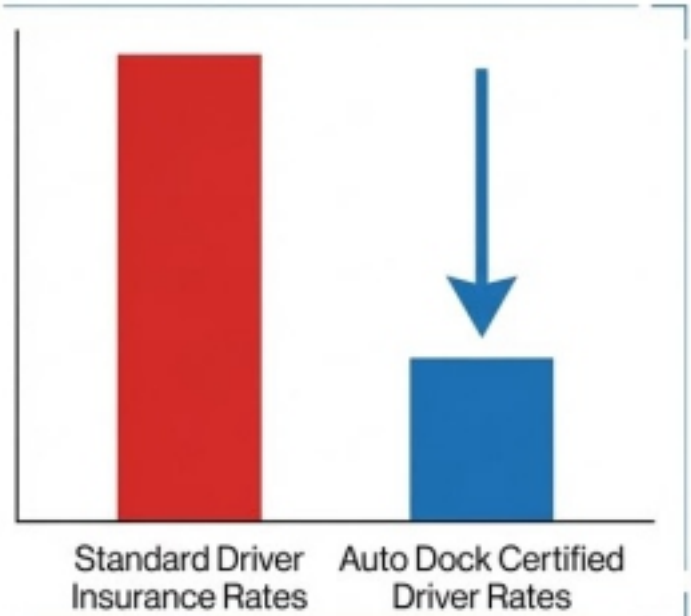
DOMISTAT INNOVATION

Systemic ROI: Actuarial Impact and Automated Compliance

A



B



[X] Reduced Distraction [X] Automated Compliance [X] Enhanced Safety

By systemically restricting phone use, the Auto Dock architecture meets the highest global safety standards. The technical rigor results in certified reduced risk, directly translating to saved lives and reduced actuarial costs.
