With LED technology now fully accepted by the automotive industry, perhaps it's time to consider implementing greater safety features, rather than just smiling headlights.

Of course car makers will always adopt their own design concepts, but there is no reason that signals can't be implemented that provide greater visual understanding and potentially less confusion.

Insurance companies might like to provide statistics on the safety of different types of turn signals, but LEDs provide clarity and can easily provide differentiation between Lane Changes and Turns - especially with integration of autonomous driving features.
