IMPROVEMENT

PDF

Spurred to action by a FaceBook post from Ed Piotrowski of WPDE,
I decided the world needed to change.
Obviously the SmartPhone has won the war about time - it updates automatically from the internet.

Once the IoT (Internet of Things) becomes a reality, there will be no need to update our appliances after every power outage or when Daylight Saving Time changes, but for now...

There is an answer.

By replacing the clock setting feature on stoves, coffee makers, microwaves, car dashboards and other annoying devices with a sensor App.

Simply push the Time Set button on your device and it will read the Time from your SmartPhone.

What about all those people without a SmartPhone?

We can't find them.
